

Pisces

This mobile lifesaving tower is inspired by a fish's geometry. Its panoramic observation platform maximises view and the frontal slides ensure no vital seconds are wasted when lifeguards respond to those in need. The tower's ease of mobility enables it to be assembled and transported by one person.

The Pisces life guard tower is made of light weight fibre glass. Constructed first, galvanised steel framing is used to strengthen and to add weight while increasing the anchorage and durability of the overall structure. A dense polystyrene layer is inserted in between the gaps of the steel frame to create a surface for the application of fibre glass. The top section is not reinforced with steel and is made solely of polystyrene and fibre glass connected by external hinges, when open into place it is held by staple like locks on the side. The platform extensions slides in and out and work as a lock to the entire structure.
